

# Which Steam Humidifier model do I have?

The Steam Humidifier is available in two sizes, each with a different humidifying capacity:

**HM609** Delivers up to 9 gallons of water each day into your home. It is generally suitable for homes 8,000 to 18,400 cubic feet in size.

**HM612** Delivers up to 12 gallons of water each day into your home. This model is generally suitable for homes 12,000 to 24,000 cubic feet in size.

**Example 1:** 2000 sq ft home: 8 ft ceilings = 16,000 cu ft. (2000 x 8)

**Example 2:** 2000 sq ft home: 10 ft ceilings = 20,000 cu ft. (2000 x 10)

**Example 3:** 2000 sq ft home: ½ with 8 ft ceilings, ½ with 12 ft ceilings. = 20,000 cu ft. ((1000 x 8) + (1000 x 12))

The proper model for your home depends on many factors. Size of the area to be humidified, ceiling height, window and insulation type, as well as your geographic area, all affect how much humidity your home needs.

Some activities in your home may create heavier loads for the Steam Humidifier. Vented fireplaces, high exhaust from fans, or driers can reduce humidity in your home and make the Steam Humidifier work harder.

Your Professional Installer or salesperson will have considered these and other factors when choosing the best Steam Humidifier model for your unique situation.
